

--ABSTRACT OF THE DISCLOSURE

A3  
The invention relates to a hinge having a swivel catch in the form of circular wedge profiles on the hinge pin and on the hinge plate 2 which swivels around the hinge pin. The angular position of these profiles with respect to one another determines the inhibiting effect. To adjust and securely retain the hinge pin in the hinge plate which bears it, the bearing surfaces of the hinge pin and of the hinge plate are provided with mutually matching profiles. A conical shape or teeth is proposed for these profiles.--
